Did you accidentally delete a whole folder of photos from your Android phone? Are you looking for a way to undo it all? Well, you're in luck. Follow the steps below and hopefully you'll be able to access your precious pictures or videos again. Unfortunately, no folder is safe from deletion. You can accidentally erase any type of content – be it images, videos, PDFs, etc. without notice. The main thing to remember is that time is of the essence. You need to try to restore your data ASAP so that it doesn't get overwritten by something else. Understanding Folders It's not always the user's fault though. You can lose folders from corrupt SD cards or unexpectedly crashing phones. Fortunately, modern devices have built-in features that enable data recovery. That means there are ways to recover lost files you might otherwise think are deleted forever. While trying the options below, try not to use your phone as much as possible. Hidden Folders Firstly, are you sure you lost your files? There is a feature that lets users hide folders for security reasons. You may have unwittingly enabled that option. To find hidden folders, follow the steps below: Go to File Manager. Tap Menu > Settings. Tap Menu > Settings. Go to Advanced. Tap Show Hidden Files. Cloud Recovery It's possible you might have cloud backup enabled in the background. There's a chance you subscribed to cloud storage solutions like Google Photos, OneDrive, or Dropbox running in the background. Without you knowing, your device automatically saved the files to your account online! Even though your files are no longer available on your mobile device, you can access copies of these by logging into your cloud account. In Google Photos, for example, you can check the trash folder for images that are not supposed to be there and return them to their proper place. Tap the hamburger menu icon near the search bar.Go to Trash.Select the images you want to recover then tap Restore. Items in the Trash folder will be deleted permanently after 60 days. SD Card If you don't have cloud storage, digging through your SD card might be your next best bet. That is assuming you saved your files on an SD card. For this method to work, you will need to connect your phone to a desktop or laptop. You will also need to download and install a data recovery program. Troubleshooting Corrupted SD Cards There are many data recovery software solutions out there. You will need to do some research and make sure the tool you use is trustworthy, easy-to-use, and effective. Check out our video on YouTube above and check out some of our other posts here: 5 Photos Recovery Tools Tested and Reviewed How to Recover Accidentally Deleted Files It's just as important to manage expectations. There's no guarantee that lost data will be recovered. Rooting an Android Phone Rooting an Android phone is not the ideal solution for average users. But if you saved all your files directly on your phone and not a memory card, this may be the only solution left. There are risks — the least of which is voiding the warranty of your device. However, recovering data from the phone itself requires root access. But if you're up for it, rooting isn't a difficult process. It can even unlock other phone features that you might find interesting. We have written several articles how to root Android phones, so please check them out depending on your device: How To Root a Nexus 5, 5X, 6, 6P, & 7 How To Root a Pixel XL, 2, 2XL, 3, & 3XL How To Root a Galaxy S5, S6, S7, S8, S9 & S10 Prevention The best way to avoid any inconvenience is preparation. Android device users have no excuse to not use Google Photos, Dropbox, or any other cloud storage app. Check out our article on how to store all your photos and videos in the cloud. While free versions have limitations, they are enough for the average user. Any solution is better than no solution. Other Data Recovery Solutions If nothing above helped you, the only other options you have are free and paid data recovery programs. If you're using an Android device, your best bet is to first try some data recovery apps from the Google Play Store. These apps can scan your SD card or Android internal storage and try to find any lost files. Make sure to pick an app that's been downloaded over 500K times and has over a 4.0 star rating. If an app doesn't work, there are some paid third-party programs out there that you can try like FoneDog, File-Recovery.com, and Remo Software. If they do have free versions, they normally will only allow you to recover a few files as proof that they can work in your situation. If you've had your iPhone for more than a few days, your home screen is likely a mess of app icons. Sure you have folders you can create to house apps of a similar nature, but a single layered folder can only go so far. Wouldn't it be nice if you could nest folders in iOS 7 like you can on a computer. For example: inside of a Media folder you could make a folder for video apps and another for music apps. That one media folder could house tons of apps while still remained easy to navigate. Unfortunately, Apple didn't see fit to add this feature to their newest mobile OS. Fortunately, YouTuber OfficialSoftModder found a bug that lets you do it anyway. ↓ Scroll down to continue reading article ↓ ↓ Scroll down to continue reading article ↓ Take a look at the video below for a rundown of how to exploit the bug. Be warned, it isn't as simple as dragging one folder over another; you'll need precise timing to get it to work. Create two folders on one home screen and add any apps you want into the folder you'll be nesting. Once, done, take a look at 1:10 in the video below for the most difficult part of the trick. You'll need to tap and hold the folder you'll be nesting then almost immediately double-tap the Home button to enter multi-task mode. If you've done well, all you'll then need to do is tap the home screen preview your folders are on, select the folder you want to nest the other folder inside of and then tap "Home". ↓ Scroll down to continue reading article ↓ ↓ Scroll down to continue reading article ↓ Though it's a finicky trick, it isn't all that hard once you figure it out. If you think it's as useful as we do, make sure to share it with your friends. ↓ Scroll down to continue reading article ↓ ↓ Scroll down to continue reading article ↓ Original Source - YouTube - Hide a Folder Within a Folder in iOS 7 ↓ Scroll down to continue reading article ↓ ↓ Scroll down to continue reading article ↓ Long-press an app and drag it onto another app to create a folder.Long-press the folder to rename it. (On some devices, tap the folder to open it, then tap the name to edit it instead.)You can also drag the folder into the row of favorite apps on the bottom of the Home screen on Android phones. This article explains how to create new folders on an Android device, how to rename those folders, and how to move them around your Home screen. The directions below should apply no matter who made your Android phone: Samsung, Google, Huawei, Xiaomi, etc. Kyle Fewel / Lifewire To create a folder, long-press an app. Press and hold a finger on the app until you feel a mild feedback vibration and the screen changes. Then, drag the app onto another app to make a folder. This is the same as on iOS devices such as the iPad and iPhone. Unlike iOS, Android doesn't provide a default name for new folders; it appears as an unnamed folder. When a folder is unnamed, nothing displays as the name of the collection of apps. To give the folder a name, long-press the folder. It opens, displays the apps, and launches the Android keyboard. Enter a name for the folder and tap the Done key. The name displays on the Home screen. Some phones do this differently. On a Samsung or Google Pixel device, tap the folder to open it, then tap the name to edit it. You can also drag the folder onto your favorite apps on the bottom of the Home screen on Android phones. That makes it two clicks to get to the app, but Google demonstrates this by grouping Google apps into a folder and putting it on the Home row at the bottom. Dragging order is important. You can drag apps onto other apps to make folders. You can drag apps into existing folders to add the app to the folder. You cannot drag folders onto apps. If an app runs away when you drag something on it, that could be what happened. The other thing you can't do is drag Home screen widgets into folders. Widgets are mini apps that run continuously on the Home screen, and won't run properly inside a folder. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! Your inbox can quickly get overwhelming. One way to better maintain your email account is to create folders (known as "labels" in Gmail) and organize your emails accordingly. Here's how to create them in Gmail. As we mentioned above, Gmail uses a system known as labels—it doesn't actually have folders. While there are some subtle differences between labels and the traditional folder (such as the ability to assign an email to multiple labels), the concept is pretty much the same. Labels are used to organize emails, just like you would with folders. Create a New Label in Gmail for Desktop To get started, open the Gmail website in your desktop browser of choice (such as Chrome) and log in to your account. Next, click the gear icon in the top-right corner of the window. A drop-down menu will appear. Click "See All Settings." Next, select the "Labels" tab. Scroll down to the "Labels" section and click the "Create a New Label" button. The "New Label" pop-up window will appear. Type the name of your new label into the text box under "Please enter a new label name." Click "Create" to generate the new label. You can also nest labels. To do that, you'll need to have at least one label already created. Just check the box next to "Nest Label Under," click the arrow to the right of the text box, and select your parent label from the drop-down menu. A toast notification will appear in the bottom-left corner of the screen letting you know the label was created. Your new label will now appear in the left-hand pane of your inbox. RELATED: Forget The Gimmicks: Here's the Best Way to Organize Your Gmail Inbox Create a New Label in Gmail for Mobile You can also create a new label using the Gmail app for iPhone, iPad, or Android. To do this, open the Gmail app on your mobile device and tap the hamburger menu icon in the top-left corner of the screen. Scroll all the way down and, under the "Labels" section, tap "Create New." Tap the text box and type the name of the new label. Next, tap "Done." Your new label is now created. Creating labels is just the first step toward better inbox management—but it's a good first step. With a little housekeeping using Gmail's email management toolset, you may even be able to reach Inbox Zero... just maybe.
